

Requirements A3  
Ramón E. Rosado

Idea/status:

UPRM student admission system: A system where candidates can submit all the required documents and the system can automatically process it.

Problem-solving:

Problem: Student candidates after successfully being accepted into the university have to submit a variety of documents and forms which are then reviewed one by one manually which makes the process tedious and long.

Situation: It's a waste of resources both for the candidate's time (since sometimes the candidate does a late submission which results in some candidates not being able to complete the process before the start of classes) and personnel (since the university takes employees from other areas to cover the vast amount of documents and form to be manually checked).

Goal: To automate the system.
